

RoamAnywhere™ Product Suite Overview

The Agito Networks RoamAnywhere Mobility Router is the industry's first and only network appliance that fuses WiFi, cellular, IP telephony and location-awareness technology to enable enterprises to mobilize voice and data applications for their workforces, while supporting all cellular carriers, enterprise PBXs and Wireless LANs.

Now more than ever, enterprise workers rely on their mobile phones for mission critical communications. While mobile communications has the undeniable benefits of better accessibility and responsiveness for mobile workers, plain old cellular service (POCS) provides challenges for both the mobile worker and enterprise IT. Challenges with POCS include poor in-building cellular coverage, skyrocketing mobile costs, no IT visibility and control over mobile usage, and lack of PBX integration with mobile phones.

Enter Agito Networks. Agito's RoamAnywhere keeps mobile workers connected to the enterprise voice applications they need, wherever they are. RoamAnywhere intelligently connects users to the best available wireless network (enterprise WiFi, cellular, home, hotspot), with fast and automatic handover as they move between networks. Fast, automatic handover keeps mobile workers connected with low-cost coverage while in-building, leveraging WiFi as a low-cost alternative to the cellular network, while drastically reducing cellular expenses with no need for cellular data plans as other solutions require.

With RoamAnywhere, administrators have greater visibility and control into mobile usage with granular identity-based reporting and CDRs, and mobile policies that adapt to users' locations, including Agito's patent-pending battery savings policies. RoamAnywhere is an appliance built with a stateful high-availability eFMC architecture, and is enterprise-ready for deployments of all sizes, scaling from 10 to 1,000 simultaneous users in a single appliance. RoamAnywhere also natively integrates with Microsoft Active Directory and LDAP to support identity-based mobility. Agito's Mobility Router is not a PBX; it is a purpose-built, hardened appliance that integrates into enterprises' existing PBX infrastructure without tampering with the desk phone like other solutions require. It uses patent-pending location technologies to address enterprise mobility challenges, and leverages the industry's most handover metrics to intelligently route users to the best available wireless network, for seamless connectivity and communication. Agito's Mobility Router is accompanied by the RoamAnywhere client, which is installed over the air with zero user touch and supports mobile devices running the Symbian and Windows Mobile operating system.

A Layered Approach to FMC

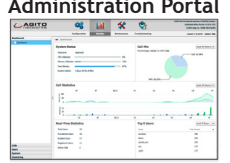

Agito Networks addresses the challenges enterprises face with plain old cellular service (POCS) with a layered approach to enterprise Fixed Mobile Convergence (eFMC). The RoamAnywhere Mobility Router is the industry's first eFMC solution to combine both the "Network Layer" and the "Application Layer" approaches to FMC.

The Application Layer:

- RoamAnywhere helps users benefit from one enterprise number, one enterprise voice mailbox and one CallerID
- Extend key desk phone features to mobile phones
- Provides administrators with greater visibility and control into mobile usage

The Network Layer:

- Provides the industry's fastest seamless handover between WLAN and cellular networks with zero user intervention
- Abstracts the underlying network from users to ensure full transparency, giving users the best possible user experience while mobile inside and outside the enterprise

RoamAnywhere Mobility Router 2000/4000 	Administration Portal 	RoamAnywhere Dialer 
<p>The RoamAnywhere Mobility Routers are built for medium to large enterprises. They support up to 1,000 simultaneous users in a single appliance, in a non-blocking, non-oversubscribed architecture. The 4000 Series can be clustered in a hot-standby, high-availability architecture.</p>	<p>The RoamAnywhere Administrator portal is a simple to use and flexible administration interface for the RoamAnywhere Mobility Router. The intuitive Web 2.0-style interface enables administrators to view reports and call detail records for the system in order to monitor usage patterns and setup policies to optimize costs and usage.</p>	<p>The RoamAnywhere Dialer software can be pre-provisioned on users' phones or installed over the air with zero user touch. It provides the industry's broadest support for mobile devices running the Symbian and Windows Mobile operating system.</p>
